Field of the Invention The present invention relates to a sheet conveying apparatus and a sheet processing apparatus, which are utilized for a printing apparatus or the like, and a method of manufacturing a sheet body. 2. Description of the Related Art A conventional printing apparatus (printing apparatus) is used to perform printing on a recording sheet (including a plain paper and a coated paper). In this conventional printing apparatus, a printing operation is performed by moving a printing head in a main scanning direction by a carriage, on the basis of image data that is input from an external apparatus or the like. When the printing operation is finished, the printing head is moved in a direction perpendicular to the main scanning direction, to thereby discharge the recording sheet (including the plain paper and the coated paper) that has

In this case, the recording sheet is fed from the cassette, on the basis of the feed-in timing of the recording sheet, which is based on the detection of the leading end of the recording sheet (hereinafter, referred to as the "leading end detection"). Upon starting the printing operation, the printing apparatus detects the leading end of the recording sheet that is loaded in the cassette. Then, it determines the leading end of the recording sheet stored in the cassette, as the leading end of the recording sheet that is loaded in the cassette. Thus, for example, when the size of the cassette is determined in advance, the leading end of the recording sheet that is loaded in the cassette is detected, on the basis of the detection result of the leading end of the a69d392a70
